## AGRAYIELD

**TOP PHOTO** Legume pasture  
Even after 10 days of minimum Temperatures of Zero or below with very little registered rain, Farmer Bill Munday of Bannister WA experienced a significant change in his Legume pasture growth, with increased root length and mass.

**BOTTOM PHOTO** Oats  
After 50 Days from the initial 3 Litre per Hectare treatment of "Agrayield", the roots were just over 220 mm long with a significant increase of earthworm activity taking place in the soil

In preparation for a 50 hectare Oats crop On the 28<sup>th</sup> May 2010 Bill treated the area With the 3 Litres per hectare of "Agrayield". On the 2<sup>nd</sup> of June 2010 the Oats crop was Planted with only 25% of his normal fertiliser rate, given that it was the worst year on record as very little registered rain fell for that September of 2010, the yield returned 2.5 ton to the hectare.

### **Ask about Benigntech's Droughtex Yield Funding Program 2011**

Based on a share farming agreement, your immediate fertiliser saving of around \$30-00 per hectare, (Based on an oats crop) See over leaf.
